

Proper maintenance of the water tank is essential for the safe supply of water.

- Minimise organic matter build up by cleaning roof and gutters every six months, this should be increased if there are tall trees and heavy bush around the property.
- The tank should be visually inspected every year. If sludge is present in the tank it should be removed. Professional tank cleaners are available.
- Tank must have water in it at all times to prevent buoyancy.
- Divert overflow of tank away from tank to prevent erosion near tank.
- Backfill around tank as much as possible to maintain structural integrity.
