

22500L Portable Tanks

Panthers Concrete Tanks construct high quality water storage solutions on a variety of residential block types, from smaller tanks on suburban blocks with limited space to large concrete tanks on spacious rural properties.

A residential concrete rainwater tank is a perfect investment to supplement your existing water supply or should town water supply not be available, as a total water storage solution for your property.

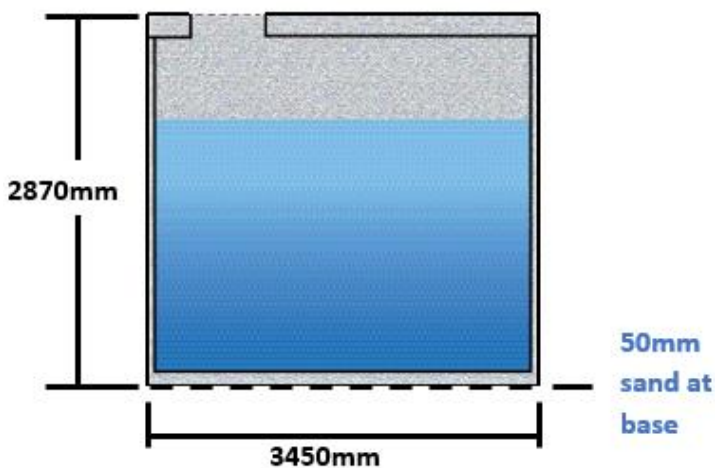

Concrete Water Tanks can be constructed anywhere on your property where there is truck access.

Tanks can be constructed below your current ground level and buried with soil once complete. This allows grass to grow over the top resulting in no tank showing, allowing all the benefits of a water tank without the loss of precious backyard space.

Underground tanks are fitted with a manhole and riser to ground level for easy access

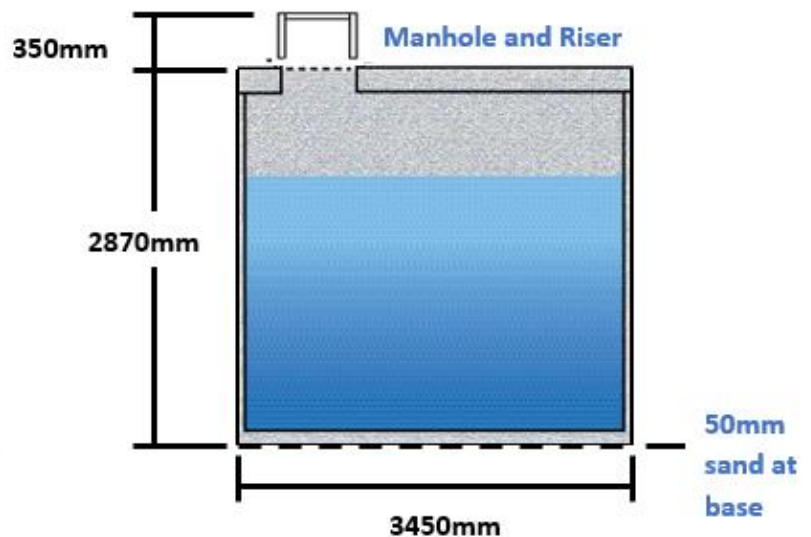

Davey Pump and RainBank Concrete Tank System available.

Inground or Above Ground Option
