

Davey Rainbank System

The automatic tank and mains water controller for your home

The Rainbank system is a small unit that can be installed between the tank and the mains water supply. Automatically switches between rainwater and mains water supply. There is no re-pumping of mains water supply. Provides seamless mains backup in the event of no rainwater or electrical interruptions, for convenience and comfort.

How the system works

- The Rainbank uses tank rainwater as the main source for the outlets such as toilet, laundry and garden taps.
- When there is no tank water it automatically and seamlessly selects mains water supply.
- When it rains and the tank refills the Rainbank automatically and seamlessly changes back to tank water supply.
- The Rainbank automatically switches between rainwater and mains water supply with lights on top indicating which one is in use.
